

About Us

Friday, 27 April 2007

Genesys, LLC was formed to develop and commercialize the RET (Radiant Energy Transfer) technology of converting water to hydrogen.

Our mission is to provide cost effective hydrogen gas that is competitive to commercially produced hydrogen or fossil fuels. We believe that hydrogen energy is the future driver of our civilization, an energy source that promises to be both plentiful and environmentally safe. The days of cheap oil are coming to an end. Global warming looms as a challenge for our society and planet. We believe both of these pivotal problems can be solved with our breakthrough technology. Imagine a world where air and water pollution from fossil fuels is a distant memory of history, or energy is plentiful and readily accessible to all. At Genesys, LLC we don't have to imagine it because the future for us is now.
